## Population Projection Methodology

- Generate county-level projection using cohortcomponent model
- 5-year age groups "aged ahead" based on existing rates
- Fertility rates
- Mortality rates
- Net migration rates
- Tract-level projections derived from tract age distribution changes between 2000-2010
- Controlled to county total
- Tract-level projections aggregated to create market area projections

Market Areas

## Jefferson County Fertility

- Births 2007-2010
- Approximately 10,400 births per year
- Total Fertility Rate: 2.08

## Jefferson County Mortality

- Deaths 2007-2010
- Approximately 6,900 deaths per year
- Life expectancy at birth: Male/74.3, Female/79.6

## Jefferson County Migration

- Net migration 2000-2010
- Net migration is in-migration minus out-migration
- Estimated from Census data

Female

Male

## Jefferson County Total Population

## Household Projection Methodology

- Current headship ratio determined for household population in each age group
- Age 15-24: 17\%
- Age 45-54: 60\%
- Age 75-84: 74\%
- Headship ratios applied to projected household populations to determine number of households
- Household size calculated as projected household population divided by projected households

## Jefferson County Households

## Jefferson County Household Size

## Tract Projections Methodology

- Generate preliminary tract-level projections using cohort change ratios
- CCR is 2000-2010 change in 10-year cohort
- Spatial adjustment to tract growth rates
- Growth is averaged between adjacent tracts
- Institute rules on tract growth rates
- Annual growth rate limit of 3\% (annual loss limit of 1\%)
- Maximum population density in 2040 is current developed land* population density in 2010
- Final tract projections are controlled to county total population
